

# AN IOIQ PRODUCT

## SUPERCHEMS™ VERSION 6.2MP

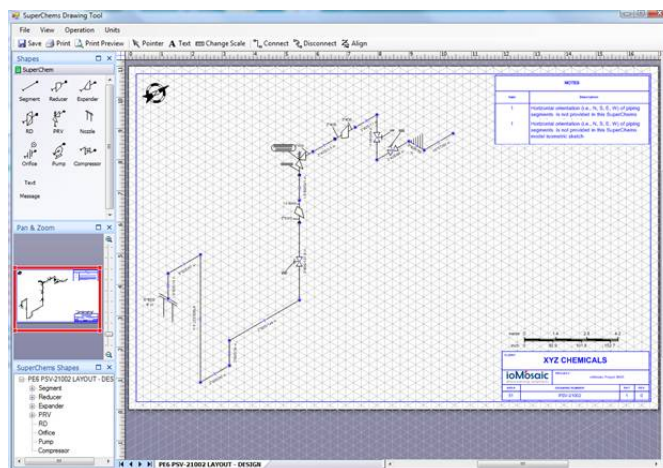

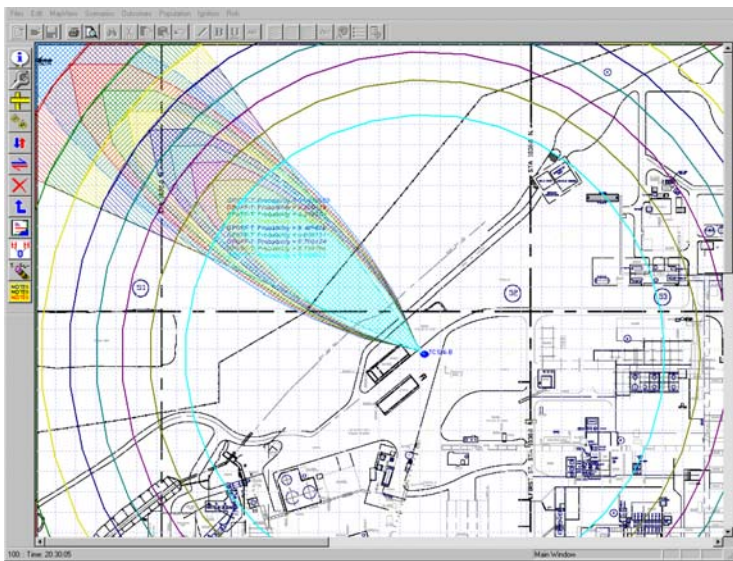

SOFTWARE FOR PRESSURE RELIEF DESIGN, CHEMICAL REACTIVITY ASSESSMENT AND MANAGEMENT, CONSEQUENCE ANALYSIS, AND QUANTITATIVE RISK ANALYSIS

**SuperChems™ Expert** is a versatile software tool that provides an integrated platform for:

- ◆ Pressure relief and Flare Systems Evaluation
- ◆ Risk Based Inspection
- ◆ Facility Siting
- ◆ Fixed facilities and Pipelines Quantitative Risk Analysis (QRA)
- ◆ Chemical Reactivity Management
- ◆ Fault Tree and SIS/SIL analysis with ioLOGIC™
- ◆ Consequence Analysis

**SuperChems™ Expert** offers a variety of well validated models for single/multi-phase reacting flow, dispersion analysis, droplet dynamics, fire, and explosion dynamics. All models in **SuperChems™** are true multi-component models with support for petroleum fractions and mixture toxicity.

### SUPERCHEMS QRA MODULE

In addition, **SuperChems™** provides several power productivity tools including:

- ◆ Advanced reporting and data lifecycle management with ioXpress™
- ◆ Failure rates database
- ◆ Thermodynamic and physical properties database for more than 2800 components with complete property estimation tools
- ◆ Reactivity Expert

As an equation-of-state-based program, **SuperChems™** provides several benefits over existing non-equation-of-state-based methods for systems involving:

- ◆ Reactions with supercritical components
- ◆ Solution effects
- ◆ *A priori* determination of phase splitting

**SuperChems™** is available in two editions: for DIERS and Expert. Its powerful engine has a proven record of handling numerous complex and unconventional systems that are not readily provided by other tools.

SuperChems™ for DIERS edition is particularly designed for the Design Institute for Emergency Relief Systems (DIERS) user group within the AIChE. Implementing DIERS two-phase technology and being empowered by SuperChems™ solid engine, SuperChems™ for DIERS is currently adopted as an industry standard tool for handling complex reactions systems and designing practical relief systems.

The QRA module was the major addition to SuperChems™. Users now have a full-blown QRA engine to define population; analyze failure frequencies; assess dependent failures; generate iso-risk contours; construct F-N curves; and perform consequence modeling, all within a central application. All consequence models are linked directly to user-defined site map with enhanced graphics, contours, and plots.

## SYSTEM REQUIREMENTS

SuperChems™ runs on any Windows-compatible machine running Windows 95, Windows 98, Windows NT, Windows 2000, Windows XP, or Windows Vista. It requires about 150 MB of hard-drive space. SuperChems™ does intensive calculations and thus requires a machine with a clock speed of 1 GHz. We, however, recommend a machine with a clock speed of at least 3 GHz.

We are committed to helping our clients achieve maximum operational effectiveness, profit protection, and business value through innovative and technically rigorous approaches to process safety design.

## VAPOR-LIQUID EQUILIBRIUM: TXY DIAGRAM

## FEATURES GUIDE TO SUPERCHEMS EXPERT AND FOR DIERS

Features	Expert	DIERS
<b>Mixture Properties</b>		
• Handles Mixtures	•	•
• Properties Databank	•	•
• Property Estimation Methods (Thermo-physical and Transport)	•	•
• Data Reduction and Regression	•	•
• Mixture Flashpoint Estimator	•	
<b>Advanced Dynamic Simulation Options</b>		
• Interlinked Vessels (flowsheet)	•	
• Vent Header Design (single and multi-phase reaction flows)	•	
• Effluent Handling Design	•	
• Plug Flow Reactors (vapor, and two-phase)	•	
<b>Vapor-Liquid Equilibrium</b>		
• Phase Envelope Generation	•	
• Common Flash Blocks	•	•
• Binary T-X-Y Diagrams	•	•
• Binary P-X-Y Diagrams	•	•
• BIPS Estimation Using UNIFAC	•	•
• VLE/VLLE Consistency Checks and Regression	•	•
• BIPS Estimation Using Limited Solubility, Azeotropic, Experimental Data, and Infinite Dilution Activity Coefficients	•	•
• Simultaneous Physical/Chemical Equilibrium	•	
• Thermodynamic Stability	•	
• P-H-S Diagrams	•	
• Heat Of Solution Diagrams	•	
<b>Reactions</b>		
• Accepts Experimental Data Such As ARC, APTAC, VSP, and RSST Data and Reaction Types Such As Tempered, Gassy, Hybrid and Inputs	•	•
• Does Heat-up Calculations To Examine If Fire Exposure Induced Runaway Reaction Can be Avoided By Insulation	•	•
• Handles Stoichiometric Reactions	•	•
• Accepts Arrhenius pre-exponential Factor and Activation Energy for Reaction Kinetics as well as other user defined forms	•	•
• Does Free Energy Minimization to Calculate Reaction Heat and Tachometry for Systems with Unknown Kinetics	•	•
• Handles Supercritical Systems	•	•
• Considers Post-relief Reaction in Vent Piping, Effluent Handling Systems, and Exit Piping	•	
• Includes Plug Flow Reactor Models for Gas and Liquid Phase Reactions	•	
• Reaction Definition Module	•	•

Features	Expert	DIERS
<b>Flow and Source Term Models</b>		
• Liquid Flow From Vessels w/wo Piping	•	•
• Liquid Pools	•	
• Two-phase Flow From Vessels w/wo Piping	•	•
• All Gas Flow From Vessels w/wo Piping	•	•
• Two-phase Flow Expansion	•	
• Gas Flow Expansion	•	
• Piping Containing Liquids	•	•
• Piping Containing Gas/Vapor	•	•
• Piping Containing Two-Phases /Subcool Liquids	•	•
• Headers Containing Liquids	•	
• Headers Containing Gas/Vapor	•	
• Headers Containing Two-Phases	•	
• Handles Alternate Relief Path	•	
• Stream Generation From SourceView	•	•
• Ideal Nozzle Flow Liquid/Subcooled, Vapor, and 2-Phase	•	•
• Sudden Flow or Valve Closure Stacks	•	•
• Unbalanced Heat Loads	•	•
<b>Systems Under Fire Exposure</b>		
• DIERS Coupling Equation and Vapor/Liquid Disengagement	•	•
• QuickSize	•	•
• Choice Of NFPA-30, API-520, API-2000	•	•
• Credit For Less Exposure To Fire When The Equipment Is Physically Blocked From Fire	•	•
• Estimation Of Sprinkler Water Density To Avoid Onset Decomposition Temperature	•	•
• User Defined Heat Flux and Adjustment to Surface Area	•	•
<b>Vessel And Pipe Flow Model Options</b>		
• DIERS Coupling Equation	•	•
• Bubbly, Churn-Turbulent, User Specified	•	•
• Vapor	•	•
• Two-phase (flashing, non-flashing/frozen, etc.)	•	•
• Bottom-Vent/Subcooled	•	•
• Homogeneous Equilibrium Flow	•	•
• Slip Equilibrium Flow	•	•
• External Streams Input To Vessel	•	•
• Inbreathing	•	
• Thermal Expansion	•	•
<b>Equipment Options</b>		
• Vertical Vessel With User Defined Heads	•	•
• Horizontal Vessel With User Defined Heads	•	•
• Spherical Vessel	•	•
• Rectangular Vessel	•	•
• Jacketed Vessels	•	•
